

PSC Tagline Retriever Tool (TRT)

A Safer Way to Retrieve Taglines

Injuries from handling, lifting or carrying loads is one the most common type of accident in the offshore industry. The successful management of this kind of risk can be achieved through the introduction of **Hands-Free and Hands-Off Safety Tools**.

Sometimes in the course of their duties riggers cannot avoid getting under a suspended load, or at least in the load shadow (the area under a load into which that load could fall and cause fatality), and it's usually because they need to catch onto the tagline to guide the lifted load into landing position.

The **PSC Tagline Retriever Tool** allows a worker to be at a much safer distance from the load when suspended and allows the worker to freely grasp and handle the tagline while remaining outside the line of fire of falling objects and the suspended load.

PSC TRT is designed to help facilitate 'hands-free' lifting and improve safety in handling taglines. The tool is a modified aluminium telescopic boat hook with a rubber buffer at the other end. The hook end is used at full extension (approximately 2.1m / 7ft) to retrieve taglines hanging vertically without a load handler having to go too close to a suspended load.

Fig a. Retracted for pushing (e.g guiding loads into tight spaces)

Fig b. Fully Extended for pulling (e.g retrieving taglines)

The rubber buffer is used to push against suspended loads to guide them, especially when landing loads in tight or congested spaces. Once again, this allows the operator to remain a safe distance from the load until it has landed. The poles would normally be fully retracted (for rigidity) during this type of use where their length is 1.2m / 4ft. However, they can be used half-extended if required but if too much pressure is applied, they will telescope in.

Exclusively imported and marketed by project sales corp, the leading hands safety specialty product company in India.

Available with a conformity certificate.
